# Guidelines For Estimating Forage Seed Production Costs - 2016

January, 2016

This guide is designed to provide planning information and a format for calculating the costs of producing the most commonly grown forage seed crops in Manitoba. General Manitoba Agriculture, Food and Rural Development (MAFRD) recommendations are assumed in using fertilizers and chemical inputs. These figures provide an economic evaluation of the crops and estimated yields required to cover all costs. Costs include labour, investment and depreciation, but do not include managmement costs, nor do they necessarily represent the average cost of production in Manitoba.

The assumptions on which the costs were calculated are clearly defined in the supporting pages. They were developed using a combination of recommended practices and methods followed by many producers.

These budgets may be adjusted by putting in your own figures. As a producer, you are encouraged to calculate your own costs of production for various forage seed crops. On each farm, costs and yields differ due to soil type, climate and agronomic practices.

This tool is available as an Excel worksheet at: <u>www.manitoba.ca/agriculture</u> or at your local <u>MAFRD GO Office</u>. <u>The Farm Machinery Custom and Rental Rate Guide</u> is also available to help determine machinery costs.

**Note:** This budget is only a guide and is not intended as an in depth study of the cost of production of this industry. Interpretation and use of this information is the responsibility of the user. If you need help with a budget, contract your local MAFRD GO office.

Costs 2016 (Dollars Per

 The costs for establishing the forage seed crop (with nurse crop) are spread over the seed production years. Establishment Cost = (Total Nurse Crop and Forage Seed Cost - Nurse Crop Revenue) / Number of Seed Production Years. eg. Alfalfa Establishment Cost (with Wheat nurse crop) = (\$ 317.97 - \$221.00) = \$96.97 / 4 = \$24.24 per acre

**Note:** This budget is only a guide and is not intended as an in depth study of the cost of production of this industry. Interpretation and utilization of this information is the responsibility of the user.

The fertilizer recommendation will vary depending on the soil type, climate and crop rotation. MAFRD recommends that soil test sampling and analysis be conducted each year to produce a better baseline for fertility. It costs \$0.50 to \$1.50/acre for custom sampling and analysis.

## Selecting a Forage Seed Crop

**NOTE:** For details on markets and available contracts contact Seed Trade firms for current applicable information. This table is intended for general reference only. It should be noted that all of the information relates to seed production management versus management for forage or turf, the management under these systems may differ significantly.

#### For more information, contact your local MAFRD GO Office or:

Derrick Chomokovski

Farm Production Advisor

#### Other Assumptions

Fuel Costs: Includes fuel used for field work, trucking in inputs and trucking out production.

Machinery Operating Costs: Includes costs for maintenance, repairs, licenses and insurance.

#### Crop Insurance: (2015 rates. New rates for 2016 are not included.)

MASC Risk Area #15 at 80% coverage. Insurance is not available on meadow fescue, birdsfoot trefoil, or red clover crops.

Other Costs: Includes overhead expenses - hydro, telephone, accounting, buildings, supplies and insurance, etc.

#### Land Taxes

The average for the province was based on land tax assessment and mill rates of a sample of municipalities growing crops less provincial tax rebate.

Drying Costs: Aeration assumed on all crops. Heated air drying costs only assigned for annual ryegrass. However, drying costs may be incurred in some years for the other crops.

Interest On Operating: Interest charges on operating costs are calculated at 5.5% for six months.

Land Investment Cost: Land values are based on appoxiamate average land values in Manitoba. Budget assumed 2.5% return on land investment

Depreciation: Assumed 10% on machinery, no salvage value.

Investment Cost:

Assumed 2.5% opportunity cost on machinery.

Estimated Farmgate Values: Crop prices are based on estimated delivery contract prices for fall 2014/15.

#### Storage Cost:

Assumed a 10% depreciation cost and 2.5% investment cost.

Farm storage requirements were assumed to cost \$1.85/bushel for 10% of the storage and \$2.35/bushel for 90% aerated storage.

#### 

Example - Tall fescue			
Non-Aeration Bins (10	<u>)%)</u>		
Depreciation:	\$5 <u>5.50-\$5.5</u> 5 20 years	\$2.50	
Investment:	\$ <u>55.50-\$5.</u> 55 2 x 2.5%	\$0.76	
	Sub-Total	\$3.26 x 10% =	\$0.33
Aeration Bins (90%)			
Depreciation:	\$7 <u>0.50-\$7.0</u> 5 20 years	\$3.17	
Investment:	\$ <u>70.50-\$7.</u> 05 2 x 2.5%	\$0.97	

#### Profitability & Breakeven Analysis:

Gross Revenue = Price per unit x Yield per acre (eg. tall fescue: \$0.50/lb x 750lb/ac = \$375.00/ac)

Sub-Total

Net Profit = Gross Revenue - Total Cost (eg. tall fescue: \$375.00 gross revenue - \$366.88 total cost = \$8.12 per acre)

Operating Expense Ratio = (Operating Cost / Gross Revenue) x 100 (eg. tall fescue: \$223.56 operating expense / \$375 total cost = 59.6%)

\$4.14 x 90% =

Total

\$3.73

\$4 05

Breakeven Price = Cost / Target Yield (eg. tall fescue cost \$366.88 / 750 lb = \$0.49 per lb)

Breakeven Yield = Cost / Price per Unit (eg. tall fescue cost \$366.88 / \$0.50 lb = 734 lb)
